MEET THE FUTURE IN THE TREATMENT OF CANCER.............

German Issue August 2001

EXOGEN-ELEKTRONIC-THERAPY (EET)

Concept EET : Dr. Hainz Meier / EXOGEN Medizintechnik AG / Regensburg

45-year old patient. Medical examinations (mammography, histology and sonography) Diagnosis: breast cancer on the right.

Histology before the treatment with Exogen-Galvano-Therapy:
Invasien – lobular breast cancer, various foci one Carcinoma lobulare.

The pictures shows the patient two years after the treatment. In total the patient became 6 treatments.

The result of control examinations after two years: no findings.
The patient is completely without symptoms.

44-year old patient. Medical examinations: (mammography and histology) Diagnosis: breast cancer

The pictures shows the patient two years after the treatment. In total the patient became 5 treatments.

The breast is unharmed, she shows caudal a nearly visible scarred retraction.

All relevant blood parameters are in the norm.

patient 50 years old

Diagnosis: Basalioma thigh

The situation after nach Exogen-Galvano-Therapy

10 V, 80 mA, 5 min.

Completely healing after 6 weeks.

This picture shows the cosmetic difference.

This is the result of a traditional surgical treatment.

39-year old patient.

This picture shows a great supraclavicular metastasis of a malignant teratoma on the left side of the neck.

The classification of the tumor: not operable.

This is the situation before the first of five treatments with Exogen-Galvano-Therapy.

This picture shows the 3. of 5 treatments with 3 intratumoral recumbent electrodes.

You see the conspicuous involution of the tumor.

After 5 treatments with circa 5000 Coulomb we see the completely involution of the tumor.

The patient is without symptoms.

1. Szirrhotic cancer of the breast
   initial situation

2. The situation after **Exogen-Galvano-Therapy**

3. You see the relevant involution of the tumor.
   We have a normalization of all tumor-parameters.

Pictures of Exogen Galvano Therapy: © Dr. Hainz Mayer, Regensburg, Germany
1. Carcinoma of the breast left. The picture shows initial status with a tumordiameter of 3,6 cm

2. After the treatment we see a relevant involution.
1. Szirrhotic Carcinome of the breast.

2. You see the complete healing after one year.
This roentgenogram shows a pulmonary tumor. The arrows show distinct the tumor and the electrodes for the Exogen-Elektronic-Therapie (EET).

The tumor is in involution. 1 ½ year after treatment the 48-year old patient feel very well he begins to make sport again.

In the foreground this picture shows the patient. On the right of the picture you can see the tube. In the background you can see the technical equipment of the nuclear spin resonance tomography.
